

Automation Assignment

General Instructions

- Framework: Playwright / Cypress (choose one)
- Follow the Page Object Model (POM) design pattern for UI automation
- Ensure assertions for:
 - UI element visibility and interaction
 - Functional flow and expected behaviors
 - API response validations and functional correctness

Application to be used for Automation

1. Access <https://www.automationanywhere.com/products/enterprise/community-edition>
2. Register using personal email ID to login to Automation Anywhere Community Edition version.

Use Case 1: Form with Upload Flow (UI Automation)

Steps:

1. Log in to the application.
2. Navigate to Automation from the left-hand menu.
3. Click on the Create dropdown and select Form.
4. Fill in all mandatory details and click the Create button.
5. From the left menu, drag and drop the Textbox and Select File elements onto the canvas.
6. Click on each element and verify all UI interactions in the right panel.
7. Enter text in the textbox and upload a document from your shared folder.
8. Save the form and verify whether the document is uploaded successfully.

Expectations:

- Build and automate a form with a Text Box and File Upload control.
- Assert the following:
 - UI element visibility and functionality

- File upload status and confirmation
- Form submission behavior and backend response

Use Case 2: Create a Process with a Form via API (API Automation)

Steps:

1. Authenticate via API using provided credentials and capture the auth token.
2. Retrieve the private workspace folder ID for the authenticated user.
3. Create a Form file in the private workspace via API (contentType: application/vnd.aa.form).
4. Save the form content with three fields: TextBox, TextArea, and Number.
5. Save the form's file dependencies via API.
6. Create a Process file in the private workspace via API (contentType: application/vnd.aa.workflow).
7. Save the process content with a 3-node workflow: InitialStep → FormStep → exit, where both InitialStep and FormStep reference the form file created above.
8. Save the process's file dependencies via API, linking the form file as a dependency.

Expectations:

- Identify required API endpoints using the browser Network tab.
- Assert the following:
 - HTTP status codes (200 OK, 201 Created) at every step
 - Form creation response contains a valid id
 - Form content save response is successful
 - Form dependencies save response is successful
 - Process creation response contains a valid id
 - Process content save response is successful
 - Process dependencies save response is successful

Submission Guidelines

- Submit your code in a GitHub repository
- Include a README.md with:
 - Setup and execution instructions
 - Framework and tools used
 - Any environment/configuration notes
- Ensure all tests are tagged with descriptive test names and organized by use case.
